

# Order

## Definition

The *order* of a group  $G$ , denoted  $|G|$  is the cardinality of the set of  $G$ .

Note that each element may appear only once in each row; otherwise, the linear equation  $ax = b$  would have more than one solution. Likewise, each element may appear only once in each column; otherwise, the linear equation  $xa = b$  would have more than one solution.

$|G| = 4$

$G = \{e, a, b, c\}$

This group is also abelian; however,  $G \not\simeq \mathbb{Z}_4$   
because:

$$\forall x \in G, xx = e$$

Thus, it is structurally different from  $\mathbb{Z}_4$ . It is referred to as the Klein-4 group, denoted by  $V$  or  $K_4$ .

So, every group of 4 elements is isometric to either  $\mathbb{Z}_4$  or  $K_4$ . Thus, there are only 2 distinct groups *up to isomorphism*.
